Thankfully, Lightroom has somewhat conquered the two-step application update process. And the times when the software crashed upon launch are also long gone. However, there were some issues regarding compatibility – I cannot exactly recall them, but I know the matter did bother me somewhat. But those happened on my side, not Lightroom's. The further away I move from the introduction of Lightroom, the bigger I find the differences to be. All the limited custom editing options that just sat there for so long are now supported. For example, we have advanced eyedropper selection and autofocus tools that I previously had to rent a Pixelmator extension for. Things like lens distortion correction, local and calibrated white balance, and address matching can now be done in-camera. So, all in all, Lightroom has proven to be untouched in terms of what feature set it has. It's like what happened with the launch of the iPad a couple of years back. It took a little while until all the leftover UI glitches and interface issues were fixed. Also, like it did with the iPad, Adobe also has a separate standalone app that features all of Lightroom's editing tools. It's called Lightroom Mobile. Overall, I can't say if Lightroom 5 is worth the upgrade for the average consumer. It's possible that folks who are attached to the program will grow a fondness for it. That said, it will certainly cater to many photo enthusiasts that require the richness and stability that Lightroom has become famous for. The new features are welcomed, and they are definitely tangible. However, I would have liked to see some of them being there since the very beginning of Lightroom. On paper, it seems like a lot of the features should have been there from the start. Instead, we have to wait until Lightroom since when it comes to the software we all know and love there's really no excuse for that.
